

# Production of $^{236}\text{Pu}$ of Suitable Purity as a Chemical Yield Tracer for Environmental Analysis

Simon Jerome

National Physical Laboratory, UK

David Parker

University of Birmingham, UK

*PTE Workshop, NPL*

*20<sup>th</sup> January 2010*

# Plutonium-236

- Why do we need it
- How we make it
- Recent work at NPL and Birmingham
- Future work

# Plutonium analysis

- Several methods available

Gravimetric

Titrimetric

$\gamma$  spectrometry

$\alpha$  spectrometry

Mass spectrometry

Mass and  $\alpha$  spectrometry need yield monitor

# Yield monitors/tracers

- What makes a good tracer?

Chemical behaviour is the same as the analyte throughout the analysis

Chemical equilibrium between tracer and sample established as soon as possible in the analysis

Tracer and analyte can be determined in each other's presence with suitable accuracy

**Harvey, B.R. and Lovett, M.B., *Nuclear Instruments and Methods*, 223, 224-234, (1984)**

# Plutonium yield tracers

- Several options exist

$^{236}\text{Pu}$  –  $\alpha$  emitter, suitable for  $\alpha$  spectrometry

$^{237}\text{Pu}^*$  –  $\beta$  emitter, possible for  $\alpha$  and mass spectrometry

$^{238}\text{Pu}$  –  $\alpha$  emitter, not suitable – present in nuclear fuel

$^{239}\text{Pu}$  –  $\alpha$  emitter, not suitable – present in nuclear fuel

$^{240}\text{Pu}$  –  $\alpha$  emitter, not suitable – present in nuclear fuel

$^{241}\text{Pu}$  –  $\alpha$  emitter, not suitable – present in nuclear fuel

$^{242}\text{Pu}$  -  $\alpha$  emitter, suitable for  $\alpha$  and mass spectrometry

$^{244}\text{Pu}$  -  $\alpha$  emitter, suitable for  $\alpha$  and mass spectrometry

\* Only if separate measurement made

# Likely nuclides

- Four choices

**$^{236}\text{Pu}$  – Short half life (1044 days); decays to  $^{232}\text{U}$ ,  $^{228}\text{Th}$  et seq; purity may be an issue; intermittently available**

*$^{237}\text{Pu}$  – Short half life (45 days); decays to  $^{237}\text{Np}$ ; no availability*

$^{242}\text{Pu}$  - Long half life ( $3.73 \times 10^5$  years); daughters not an issue; low levels in nuclear fuel; supplies running out of suitably pure material

$^{244}\text{Pu}$  - Long half life ( $8.0 \times 10^7$  years); daughters not an issue; purity good only for mass spectrometry; availability is reasonable

# Plutonium-236 decay scheme

# Plutonium-236 decay radiation

$\alpha$  decay – 100% (spontaneous fission  $< 1 \times 10^{-6}\%$ ):

5721.00 ( $\pm 0.10$ ) keV, intensity 30.56 ( $\pm 0.45$ )%

5767.66 ( $\pm 0.08$ ) keV, intensity 69.26 ( $\pm 0.45$ )%

*X-rays:*

*11.62 keV, intensity 0.28 ( $\pm 0.03$ )%*

*~13.5 keV, intensity ~4.6 ( $\pm 0.3$ )%*

*15.40 keV, intensity 0.113 ( $\pm 0.011$ )%*

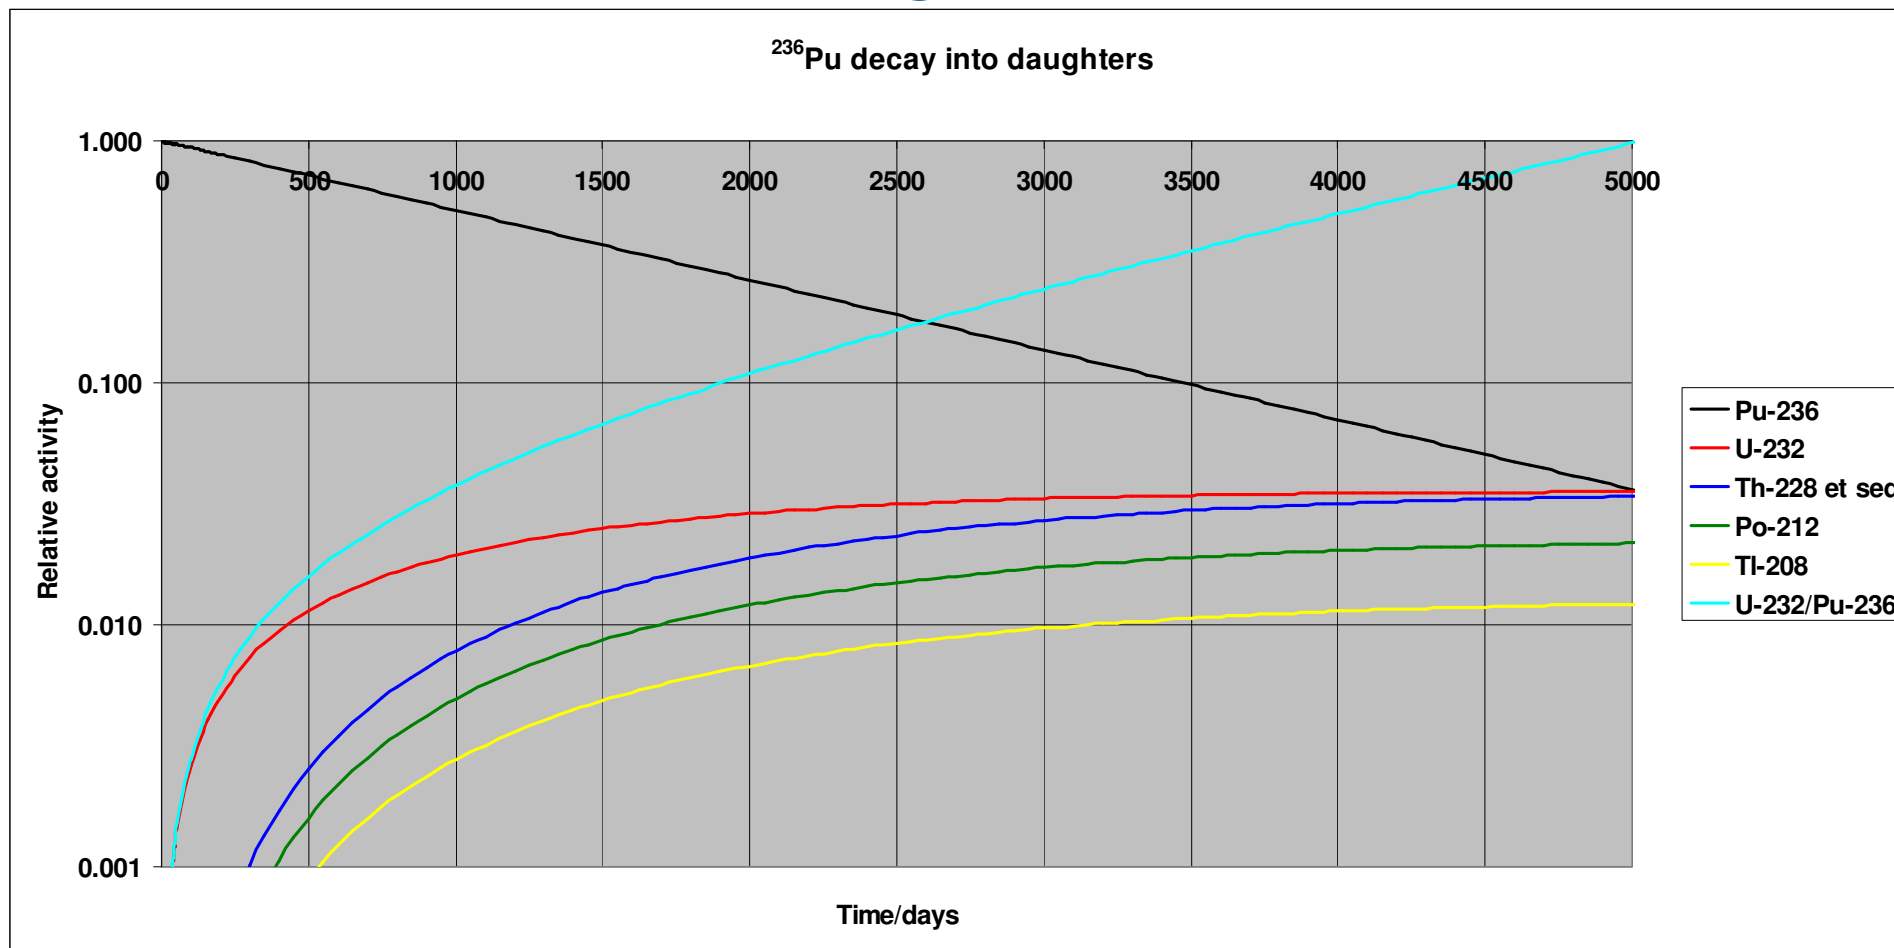

*16.41 keV, intensity 1.07 ( $\pm 0.07$ )%*

*~17.1 keV, intensity ~4.5 ( $\pm 0.4$ )%*

*~20.5 keV, intensity 1.2 ( $\pm 0.2$ )%*

# Plutonium-236 daughter radionuclides

# Production

- Different routes available

Buy it!

Which we did – and produced a batch of low level (5g @ 10 Bq/g) and high level standards (5g @ 150 Bq/g) – contact Chris Gilligan: [chris.gilligan@npl.co.uk](mailto:chris.gilligan@npl.co.uk)

Charged particle irradiation of Uranium

Photon irradiation of  $^{237}\text{Np}$

Decay of  $^{236\text{m}}\text{Np}$

**Purity is the issue**

# Charged particle irradiation

- Various possibilities – but mainly

Irradiation of  $^{235}\text{U}$  with  $\alpha$  particles at up to 40 MeV

$^{236}\text{Pu}$ ,  $^{237}\text{Pu}$  and  $^{238}\text{Pu}$  produced directly and  $^{236}\text{Pu}$  and  $^{238}\text{Pu}$  produced from  $\beta$  decay of  $^{236\text{m}}\text{Np}$  and  $^{238}\text{Np}$ ; also  $^{239}\text{Pu}$  and  $^{240}\text{Pu}$  from  $^{238}\text{U}$ ; fission products

Irradiation of  $^{238}\text{U}$  with protons at up to 50 MeV

$^{236}\text{Pu}$  and  $^{238}\text{Pu}$  produced from  $\beta$  decay of  $^{236\text{m}}\text{Np}$  and  $^{238}\text{Np}$ ; also  $^{235}\text{Np}$  and  $^{237}\text{Np}$ ; fission products

Irradiation of  $^{235}\text{U}$  with deuterons below 20 MeV

$^{235}\text{Np}$  produced directly;  $^{236}\text{Pu}$  produced from  $\beta$  decay of  $^{236\text{m}}\text{Np}$ ; also  $^{238}\text{Pu}$  from  $^{237}\text{Np}$ ,  $^{239}\text{Pu}$  and  $^{240}\text{Pu}$  from  $^{238}\text{U}$ ; fission products

# Irradiation of $^{235}\text{U}$ with deuterons

- Selected as route with best potential for purity

Useful

**Required**

Not an issue

Useful

*Problem*

*Problem*

*Problem*

*Problem*

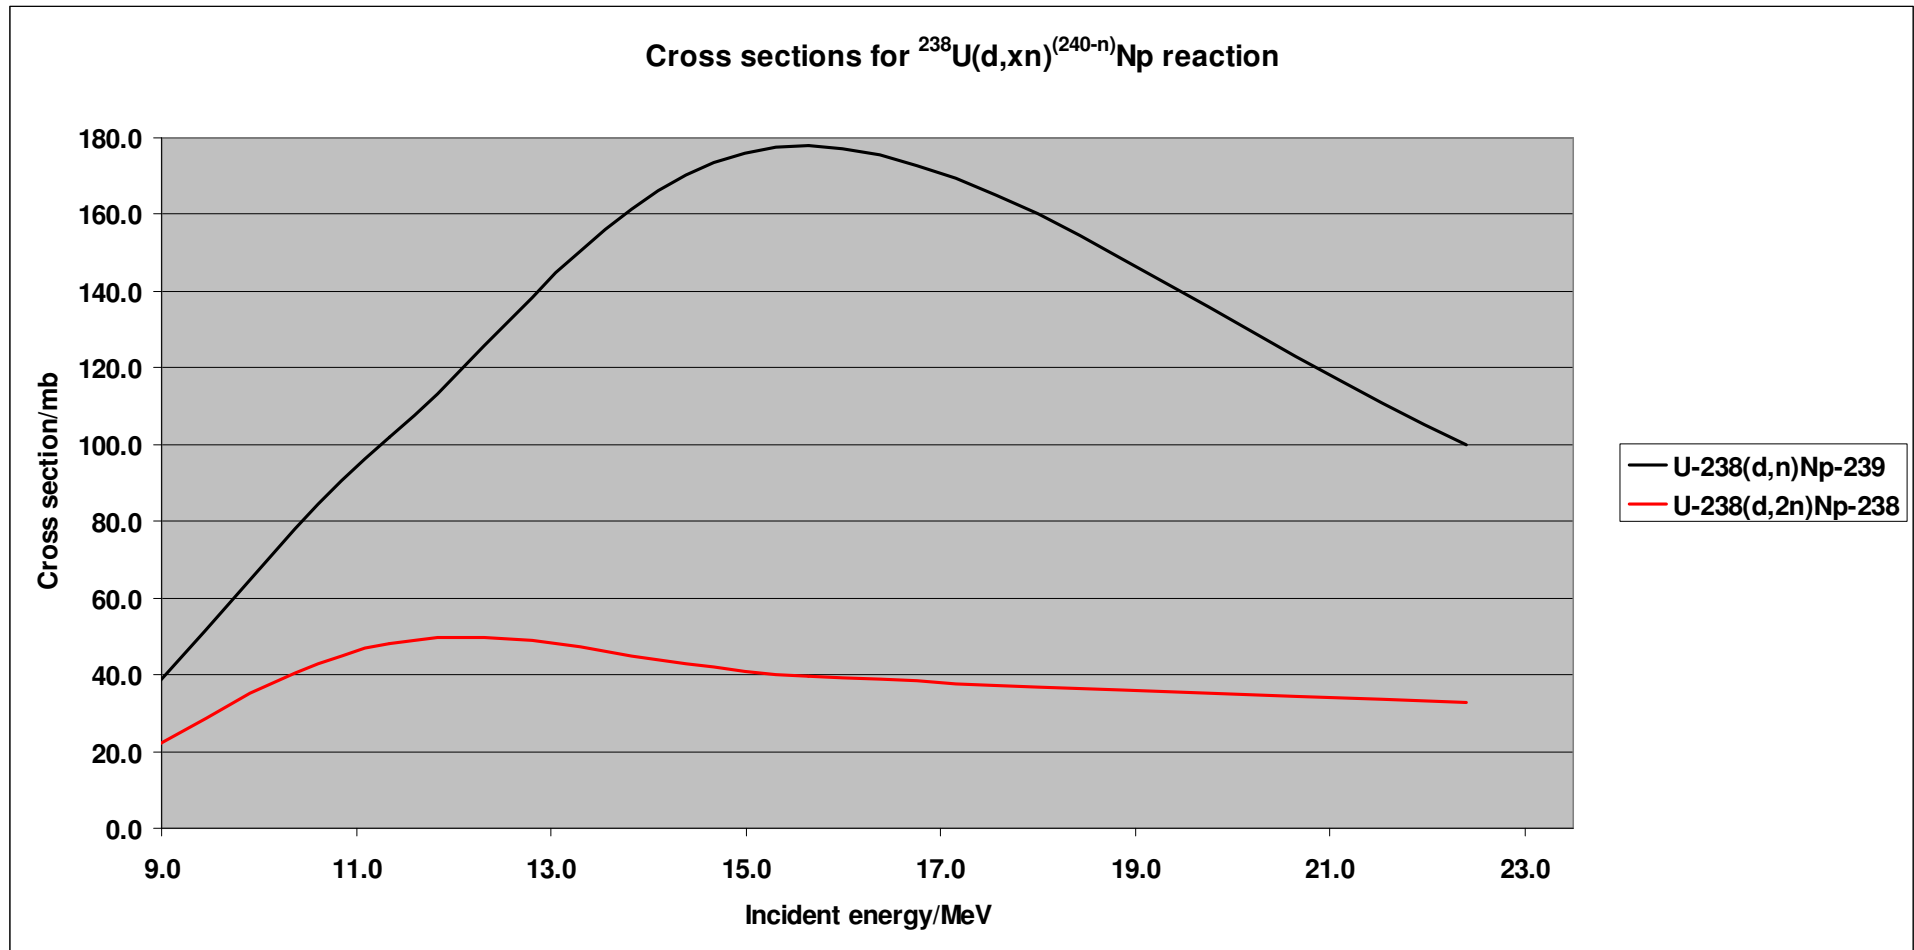

*Problem*

# Irradiation of $^{235}\text{U}$ and $^{236}\text{U}$ with deuterons

# Irradiation of $^{238}\text{U}$ with deuterons

# Irradiation of $^{235}\text{U}$ with Deuterons (1990)

- Products

$^{233}\text{Np}$ : From  $^{233}\text{U}(d,2n)$ , not important

$^{234}\text{Np}$ : From  $^{233}\text{U}(d,n)$  and  $^{234}\text{U}(d,2n)$ , not important

**$^{235}\text{Np}$ : From  $^{234}\text{U}(d,n)$  and  $^{235}\text{U}(d,2n)$ , important**

**$^{236\text{m/g}}\text{Np}$ : From  $^{235}\text{U}(d,n)$  and  $^{236}\text{U}(d,2n)$ , important**

$^{237}\text{Np}$ : From  $^{236}\text{U}(d,n)$ , not (very) important

$^{238}\text{Np}$ : From  $^{238}\text{U}(d,2n)$ , important – impurity; leading to  $^{238}\text{Pu}$

$^{239}\text{Np}$ : From  $^{238}\text{U}(d,n)$ , important – impurity; leading to  $^{239}\text{Pu}$

# Irradiation of $^{235}\text{U}$ with Deuterons (1990)

- Results obtained by Efurd

$^{235}\text{Np}$  –  $\sim 7.4$  MBq ( $\sim 3.7 \times 10^{14}$  atoms)

$^{236\text{m}}\text{Np}$  –  $\sim 1.7$  GBq ( $\sim 2 \times 10^{14}$  atoms)

$^{236\text{g}}\text{Np}$  –  $\sim 8.5$  Bq ( $\sim 6 \times 10^{13}$  atoms)

$^{237}\text{Np}$  –  $\sim 0.13$  Bq ( $\sim 1.3 \times 10^{13}$  atoms)

$^{236}\text{Pu}$  –  $\sim 1.5$  MBq ( $\sim 2 \times 10^{14}$  atoms from  $^{236\text{m}}\text{Np}$  decay) –  $\sim 190$  Bq/g/ $\mu\text{A}/\text{h}$

$^{238}\text{Pu}$  –  $\sim 820$  Bq ( $\sim 3.3 \times 10^{12}$  atoms)

$^{239}\text{Pu}$  –  $\sim 12$  Bq ( $\sim 1.3 \times 10^{13}$  atoms)

$^{240}\text{Pu}$  –  $\sim 0.051$  Bq ( $\sim 1.5 \times 10^{10}$  atoms)

...and  $8 \times 10^{16}$  fissions

# University of Birmingham Cyclotron

- Scanditronix MC40 cyclotron transferred from Minneapolis to Birmingham in 2002-2004

Proton beam: <9 and 12 – 39 MeV

Deuteron beam: 6 – 19.5 MeV

$^3\text{He}$  beam: <27 and 36 – 54 MeV

$\alpha$  beam: 12 – 39 MeV

12-way switching magnet added in 2005  
(ex Strasbourg)

Extended to second target room (with  
original switching magnet) in 2007

# University of Birmingham Cyclotron

- Main work is isotope production:

$^{81}\text{Rb}$  ( $^{82}\text{Kr}(p,2n)$  at 30 MeV) 75 GBq per night, 5 nights per week - two dedicated target stations

$^{18}\text{F}$  and other positron emitters for industrial PET research

Thin layer activation

Conventional p and d activations

$^3\text{He}$  activation of diamond-like carbon

UTLA activation of plastics  $^{12}\text{C}(^3\text{He}, 2\alpha)^7\text{Be}$

Radiation effects (very low currents)

Local facility for nuclear physics

# Irradiation of $^{235}\text{U}$ with Deuterons (2009)

- Irradiation at Birmingham, chemistry at NPL

$^{235}\text{U}$ enrichment:	99.887%
	( $^{233}\text{U}$ – <0.0005%, $^{234}\text{U}$ – 0.034%, $^{236}\text{U}$ – <0.025%, $^{238}\text{U}$ – <0.053%)
Amount irradiated:	0.08 grams
Incident energy:	19 MeV
Target thickness:	~25 mg/cm <sup>2</sup>
Irradiation time:	2 hours
Target backing:	Copper

# Irradiation of $^{235}\text{U}$ with Deuterons (2009)

- Chemistry at NPL

Precipitation of actinides with yttrium

Dissolve  $\text{Y}(\text{OH})_3$  in HCl

Anion exchange in 6M HCl

Uranium, Neptunium and Plutonium retained by resin

Wash column with 12M HCl

Remove Plutonium with 12M HCl/0.1M  $\text{NH}_4\text{I}$

Remove Neptunium with 3M HCl

Recover Uranium with 0.1 M HCl

Repeat clean up on actinide fractions

# Irradiation of $^{235}\text{U}$ with Deuterons (2009)

- Results obtained in 2009

$^{235}\text{Np}$  –  $\sim 7.4 \text{ kBq}$  ( $\sim 3.7 \times 10^{11}$  atoms)

$^{236\text{m}}\text{Np}$  –  $\sim 1.7 \text{ MBq}$  ( $\sim 2 \times 10^{11}$  atoms)

$^{236\text{g}}\text{Np}$  –  $\sim 0.0085 \text{ Bq}$  ( $\sim 6 \times 10^{10}$  atoms)

$^{237}\text{Np}$  –  $\sim 0.00013 \text{ Bq}$  ( $\sim 1.3 \times 10^{10}$  atoms)

$^{236}\text{Pu}$  –  $\sim 1.5 \text{ kBq}$  ( $\sim 2 \times 10^{11}$  atoms from  $^{236\text{m}}\text{Np}$  decay) –  $\sim 310 \text{ Bq/g}/\mu\text{A/h}$

$^{238}\text{Pu}$  –  $< 6 \text{ Bq}$  ( $< 2.4 \times 10^{10}$  atoms)

$^{239}\text{Pu}$  –  $< 2.1 \text{ Bq}$  ( $< 2.3 \times 10^{12}$  atoms)

$^{240}\text{Pu}$  –  $< 2.1 \text{ Bq}$  ( $< 6.3 \times 10^{11}$  atoms)

500 MBq  $^{65}\text{Zn}$ ...

...and  $4.5 \times 10^{13}$  fissions

# Irradiation of $^{235}\text{U}$ with Deuterons (2009)

- Results obtained in 2009

$^{236}\text{Pu}$  – **>99.5% by activity**

$^{238}\text{Pu}$  – <0.38% by activity\*

$^{239}\text{Pu}$  – <0.14% by activity\*

$^{240}\text{Pu}$  – <0.14% by activity\*

Overall yield better

Need to improve purity assay

Repeat experiment by end of year with thicker target

\* - upper limit

# Irradiation of $^{235}\text{U}$ with Deuterons (2009)

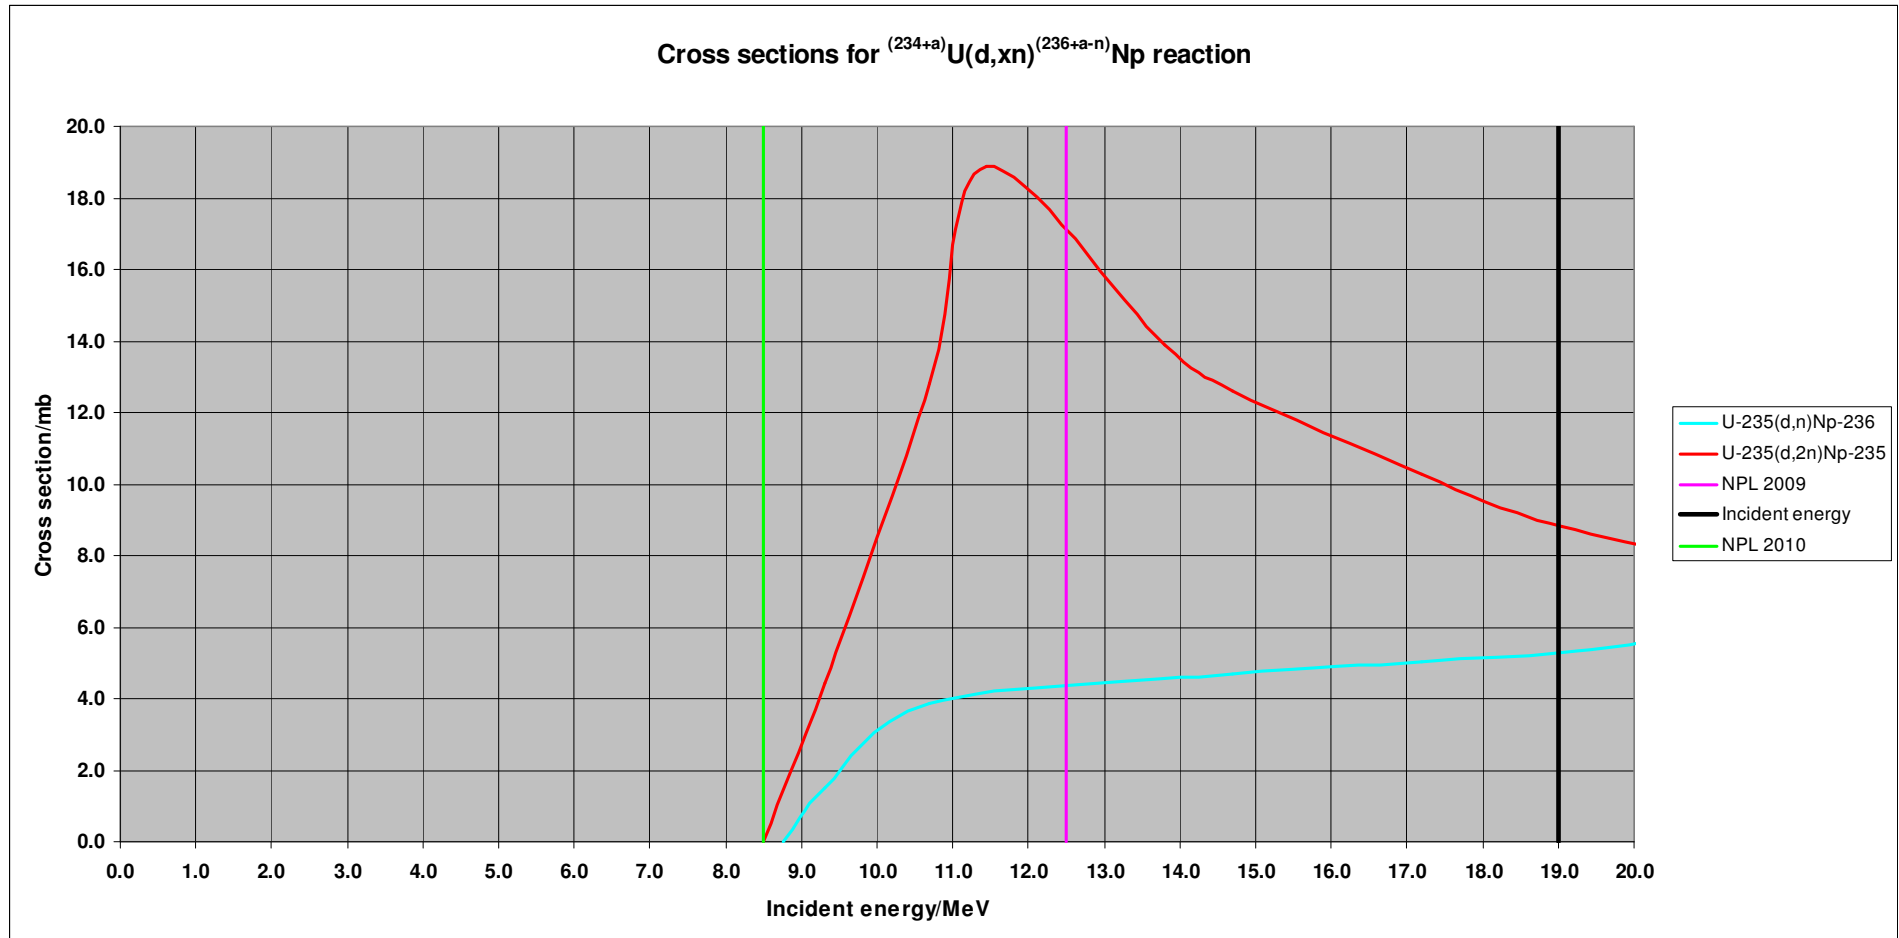

- Results obtained in 2009

Yield (as Bq/g/ $\mu\text{A}/\text{h}$ ) better as

- less wasted on purely fission reaction (<8.5 MeV)
- Expect lower neutron yield, so fewer  $^{238}\text{U}(n,\gamma)^{239}\text{Np}(\beta^-)^{239}\text{Pu}$  reactions
- Lower fission yield, so easier to handle

# Irradiation of $^{235}\text{U}$ with Deuterons

# Irradiation of $^{235}\text{U}$ with Deuterons (2009)

- Next irradiation

$^{235}\text{U}$ enrichment:	99.887%
	( $^{233}\text{U}$ – <0.0005%, $^{234}\text{U}$ – 0.034%, $^{236}\text{U}$ – <0.025%, $^{238}\text{U}$ – <0.053%)
Amount irradiated:	1.2 grams
Incident energy:	19 MeV
Target thickness:	~380 mg/cm <sup>2</sup>
Irradiation time:	20 hours
Target backing:	Copper

# Irradiation of $^{235}\text{U}$ with Deuterons (2009)

- Expected results

$^{235}\text{Np}$  –  $\sim 1.7 \text{ MBq}$  ( $\sim 8.4 \times 10^{13}$  atoms)

$^{236\text{m}}\text{Np}$  –  $\sim 710 \text{ MBq}$  ( $\sim 8.3 \times 10^{13}$  atoms)

$^{236\text{g}}\text{Np}$  –  $\sim 2 \text{ Bq}$  ( $\sim 1.4 \times 10^{13}$  atoms)

$^{237}\text{Np}$  –  $\sim 0.03 \text{ Bq}$  ( $\sim 3 \times 10^{12}$  atoms)

$^{236}\text{Pu}$  –  $\sim 300 \text{ kBq}$  ( $3.9 \times 10^{13}$  atoms from  $^{236\text{m}}\text{Np}$  decay)

$^{238}\text{Pu}$  –  $< 20 \text{ Bq}$  ( $< 6.4 \times 10^{10}$  atoms)

$^{239}\text{Pu}$  –  $< 1 \text{ Bq}$  ( $< 2.5 \times 10^{11}$  atoms)

$^{240}\text{Pu}$  –  $< 1 \text{ Bq}$  ( $< 3 \times 10^8$  atoms)

...and  $2.7 \times 10^{16}$  fissions

# Irradiation of $^{235}\text{U}$ with Deuterons (2009)

- Expected outcomes

Better purity data for  $^{236}\text{Pu}$

Useable source of  $^{235}\text{Np}$

Fission products –  $^{91}\text{Y}$ ,  $^{95}\text{Zr}$ ,  $^{106}\text{Ru}$ ,  $^{144}\text{Ce}$ ,  $^{147}\text{Nd}$

# Irradiation of $^{235}\text{U}$ with Deuterons (2010)

- Possible irradiation

$^{235}\text{U}$ enrichment:	99.994%
	( $^{233}\text{U}$ – <0.006%, $^{234}\text{U}$ – <0.006%, $^{236}\text{U}$ – <0.006%, $^{238}\text{U}$ – <0.006%)*
Amount irradiated:	1.0 grams
Incident energy:	19 MeV
Target thickness:	~320 mg/cm <sup>2</sup>
Irradiation time:	20 hours
Target backing:	Copper

\* - upper limit

# Irradiation of $^{235}\text{U}$ with Deuterons (2010)

- Expected results

$^{235}\text{Np}$  –  $\sim 1.4 \text{ MBq}$  ( $\sim 7 \times 10^{13}$  atoms)

$^{236\text{m}}\text{Np}$  –  $\sim 590 \text{ MBq}$  ( $\sim 6.9 \times 10^{13}$  atoms)

$^{236\text{g}}\text{Np}$  –  $\sim 2 \text{ Bq}$  ( $\sim 1.2 \times 10^{13}$  atoms)

$^{237}\text{Np}$  –  $\sim 0.03 \text{ Bq}$  ( $\sim 2.5 \times 10^{12}$  atoms)

$^{236}\text{Pu}$  –  $\sim 250 \text{ kBq}$  ( $3.3 \times 10^{13}$  atoms from  $^{236\text{m}}\text{Np}$  decay)

$^{238}\text{Pu}$  –  $< 200 \text{ Bq}$  ( $< 5.3 \times 10^{11}$  atoms)

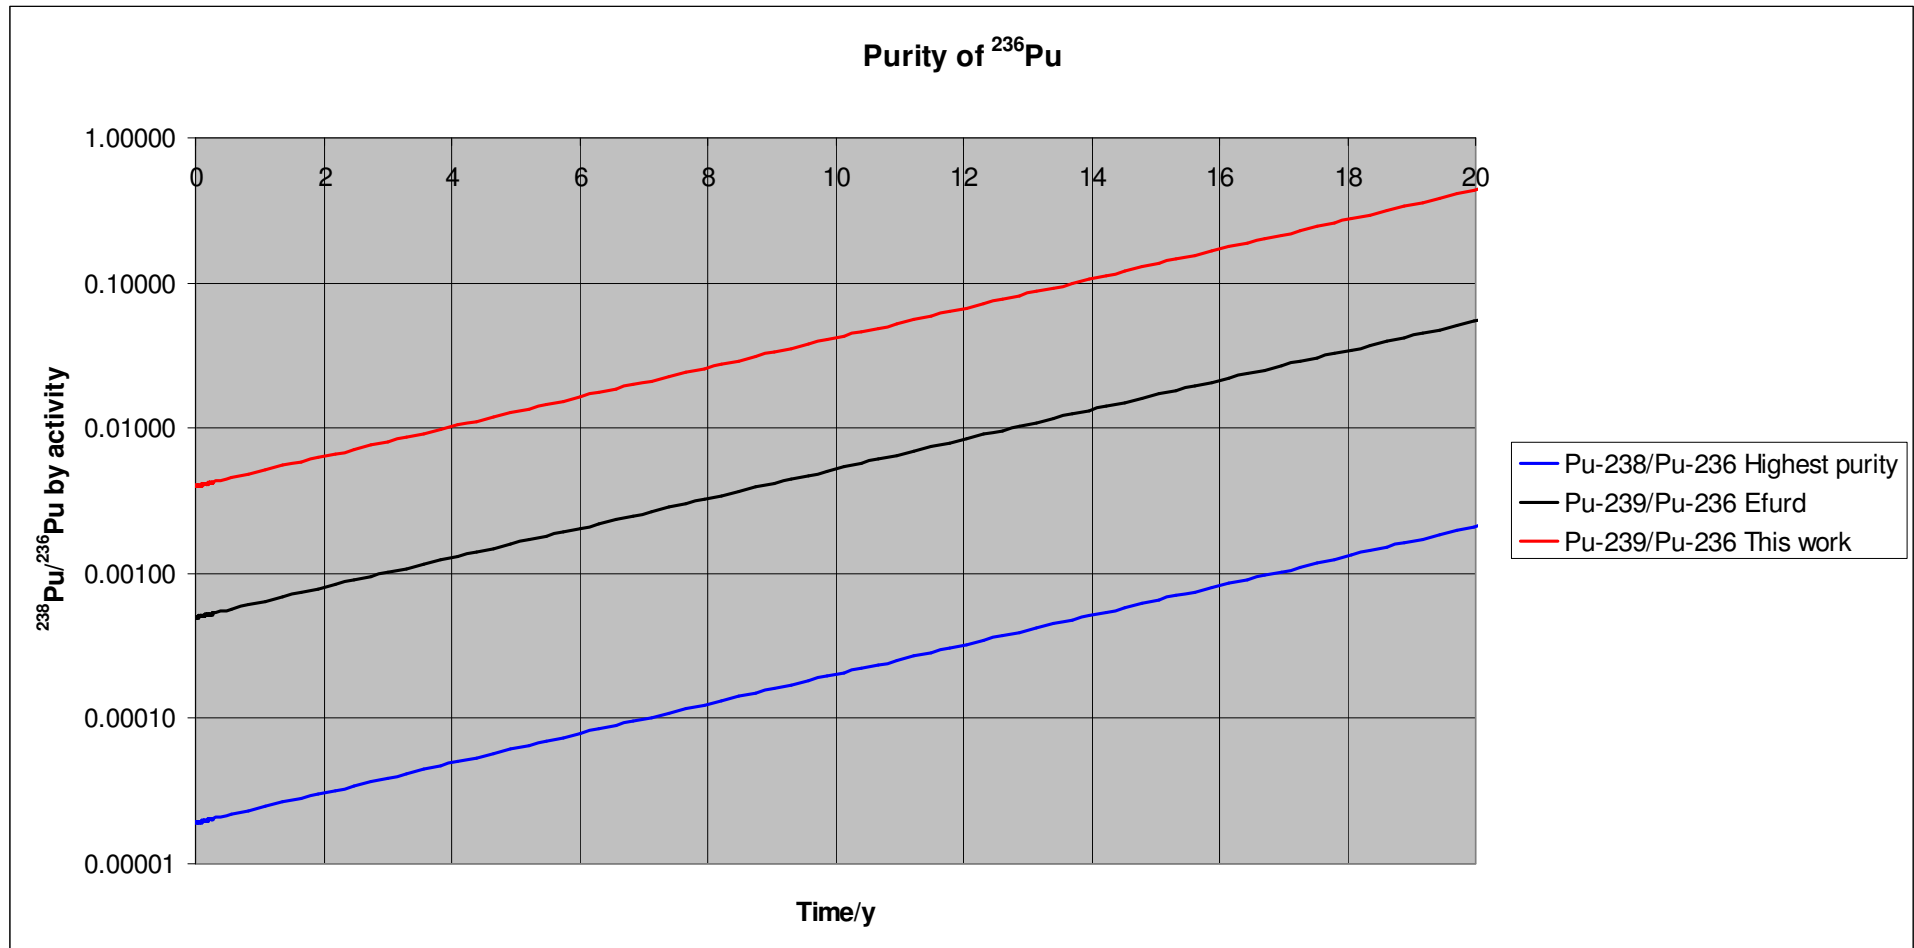

$^{239}\text{Pu}$  –  $< 3 \text{ Bq}$  ( $< 2.1 \times 10^{12}$  atoms)

$^{240}\text{Pu}$  –  $< 1 \text{ Bq}$  ( $< 2.5 \times 10^9$  atoms)

...and  $2.3 \times 10^{16}$  fissions

# Irradiation of $^{235}\text{U}$ with Deuterons (2010)

# Irradiation of $^{237}\text{Np}$ with $\gamma$ (2010)

- Experimental

Irradiate Tungsten or Tantalum target in a LINAC to produce high energy  $\gamma$  photons

Irradiate pure  $^{237}\text{Np}$  as  $\text{NpO}_2$  in photon flux

Produce  $^{236\text{m}}\text{Np}$ , allow to decay:

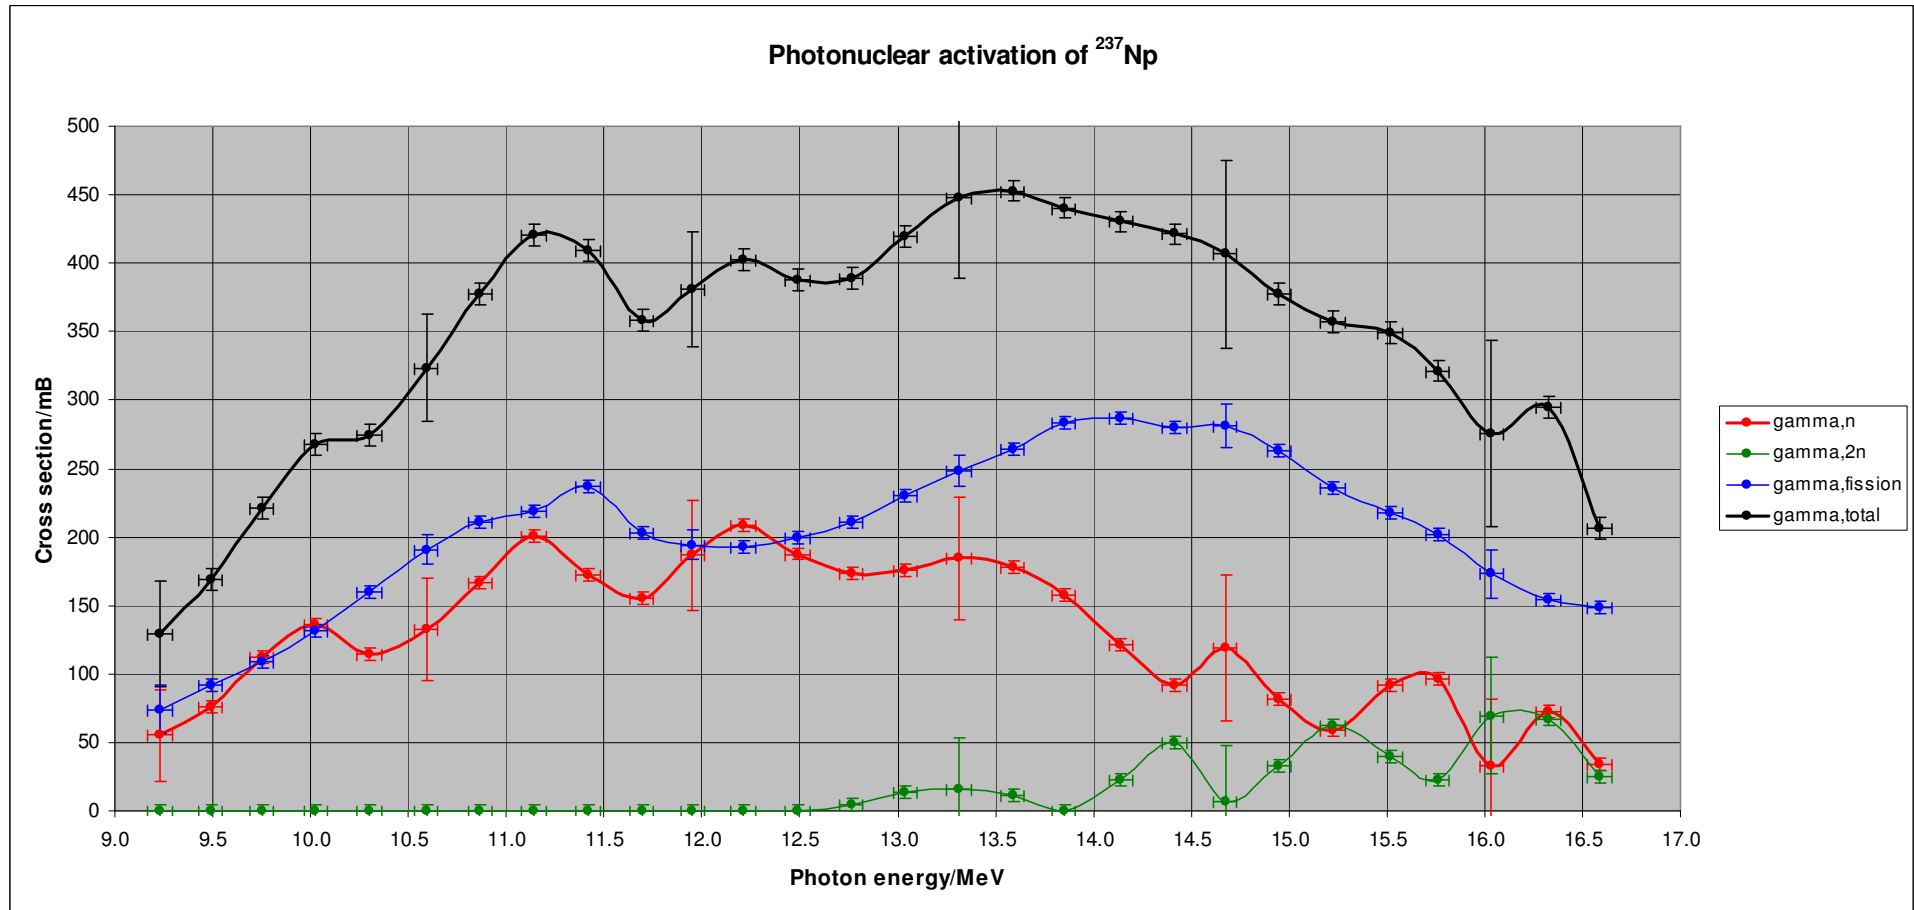

Advantages – fewer fission products

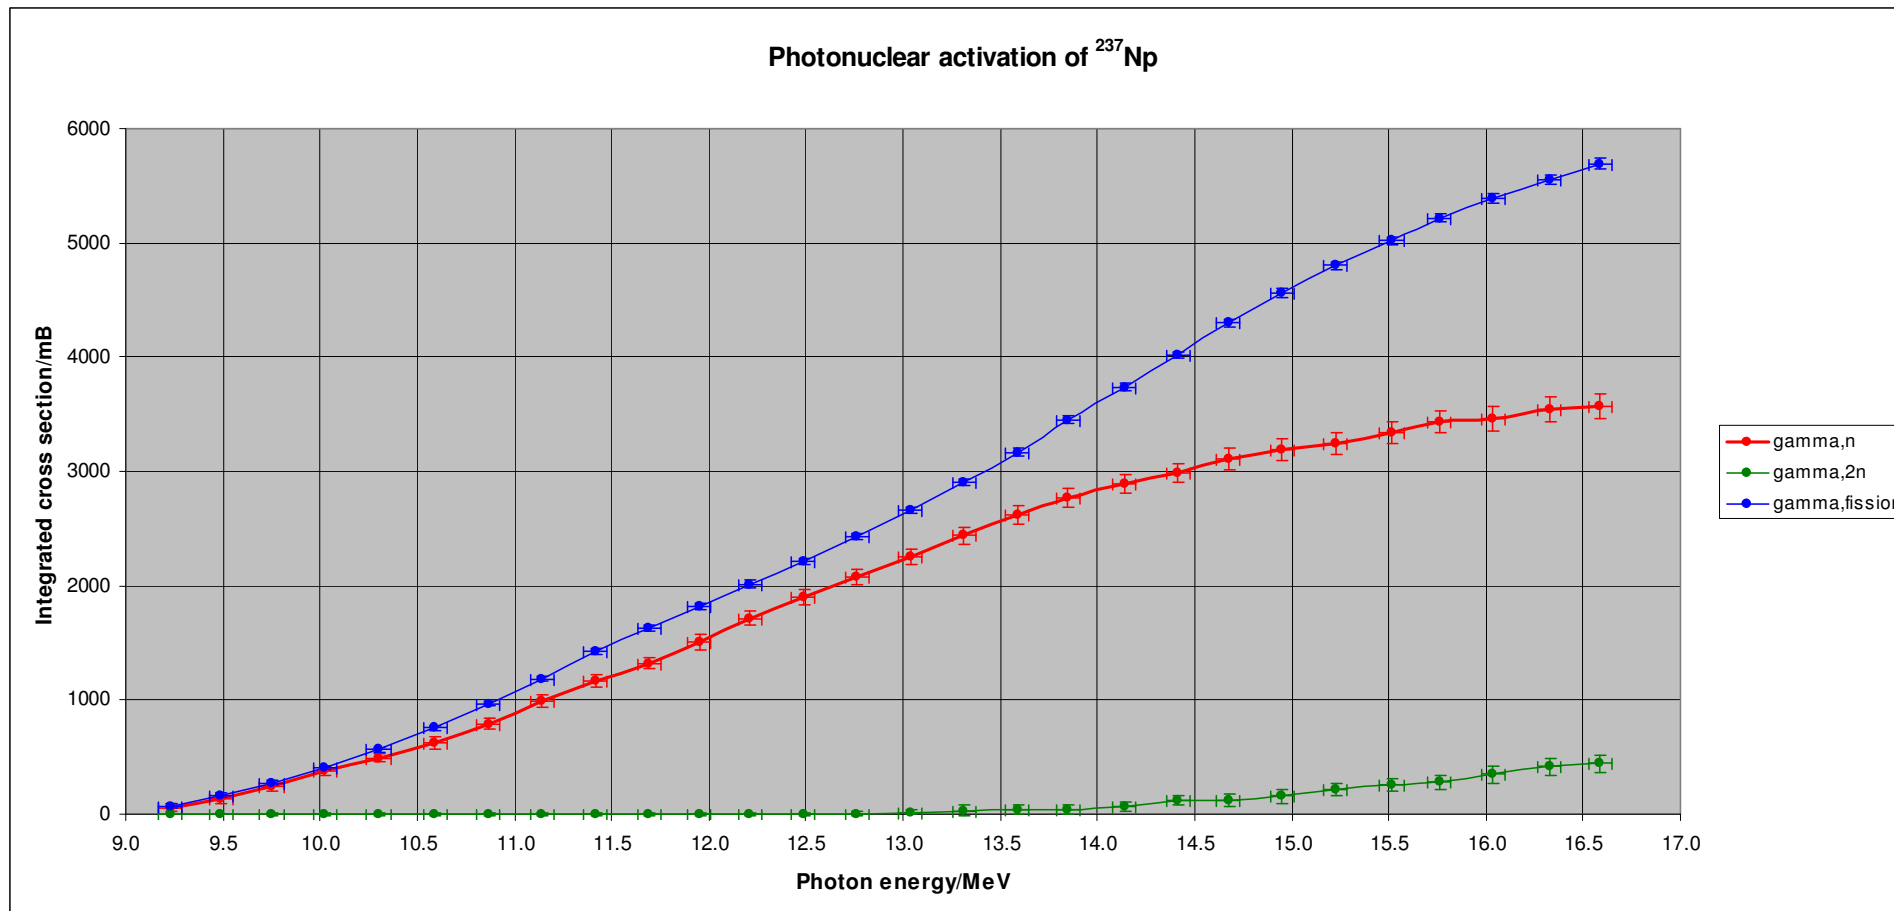

Disadvantages – possible to produce  $^{238}\text{Pu}$  via

# Irradiation of $^{237}\text{Np}$ with $\gamma$ (2010)

# Irradiation of $^{237}\text{Np}$ with $\gamma$ (2010)

# Irradiation of $^{237}\text{Np}$ with $\gamma$ (2010)

- NPL research LINAC

Beam current up to 1 mA

Energy available 18-20 MeV

We hold ~500 mg pure  $^{237}\text{Np}$  as  $\text{NpO}_2$  for such work

Discrepancy between reported production rates:

~3900 Bq/g/ $\mu\text{A}/\text{h}$  reported by Dmitriev *et al*

~150 Bq/g/ $\mu\text{A}/\text{h}$  measured at UKAEA

# Irradiation of $^{237}\text{Np}$ with $\gamma$ (2010)

- Next irradiation

$^{237}\text{Np}$ enrichment:	>99.99%
Amount irradiated:	0.1 grams
Incident energy:	Up to 19 MeV
Irradiation time:	10 hours
Target backing:	Copper

Fewer fission products (~300 times)

Much higher amount of  $^{237}\text{Np}$  to exclude

# Irradiation of $^{237}\text{Np}$ with $\gamma$ (2010)

- Expected results

$^{235}\text{Np}$  –  $\sim 100 \text{ kBq}$  ( $\sim 5.2 \times 10^{12}$  atoms)

$^{236\text{m}}\text{Np}$  –  $\sim 360 \text{ MBq}$  ( $\sim 4.2 \times 10^{13}$  atoms)

$^{236\text{g}}\text{Np}$  –  $\sim 1 \text{ Bq}$  ( $\sim 7 \times 10^{12}$  atoms)

$^{237}\text{Np}$  –  $\sim 13 \text{ MBq}$  ( $\sim 1.3 \times 10^{21}$  atoms)

$^{236}\text{Pu}$  –  $\sim 150 \text{ kBq}$  ( $2 \times 10^{13}$  atoms from  $^{236\text{m}}\text{Np}$  decay)

$^{238}\text{Pu}$  –  $< 20 \text{ Bq}$  ( $< 5.3 \times 10^{10}$  atoms)

$^{239}\text{Pu}$  –  $< 1 \text{ Bq}$  ( $< 7 \times 10^{11}$  atoms)

$^{240}\text{Pu}$  –  $< 1 \text{ Bq}$  ( $< 2.5 \times 10^9$  atoms)

...and  $6.7 \times 10^{13}$  fissions

**Thank You**

**Any questions?**
